 - Euroimmun

Learning Outcomes

1. To review some of the existing international research networks and groups
2. To review some of the ongoing studies on adult vasculitis, in which Canada participates
3. To discuss issues pertinent to various specialties (internal medicine, rheumatology, nephrology and respirology) including research collaboration in Canada
4. To be aware of CanVasc and its activities in adult vasculitis

DCVAS Study

- ACR/EULAR diagnostic and classification criteria for vasculitis
- Number of centres: 118

This project anticipates to produce the following:

- 1) A new validated set of **classification** criteria for the primary systemic vasculitides.
- 2) A validated set of **diagnostic** criteria for the primary systemic vasculitides.

DCVAS Study

- *How will the final revisions differ from the current ACR criteria?*
- The main differences will be:
- Use modern diagnostic tests (e.g. ANCA, use of diagnostic ultrasound for GCA), new tools of disease activity (BVAS) and tools measuring vasculitis damage (VDI) to further refine the criteria.
- Develop a reference standard by using clustering of clinical features, from real and hypothetical cases so that an expert panel may define a boundary around these clinical features to define each disease
- Develop diagnostic criteria which can be used in daily clinical practice. The current ACR criterion was never intended for, and does not function well for this purpose.

DCVAS Study

Latest recruitment is over 5032 patients from 129 sites

DCVAS top recruiting sites end June 2015

Rare Diseases Medical Center

Welcome! The Vasculitis Clinical Research Consortium (VCRC) is an integrated group of academic medical centers, patient support organizations, and clinical research resources dedicated to conducting clinical research in different forms of vasculitis. It is our goal to improve the care of patients with Wegener's granulomatosis, microscopic polyangiitis, Churg-Strauss syndrome, polyarteritis nodosa, Takayasu's arteritis, and giant cell (temporal) arteritis.

We Can Help You:

- Become aware of clinical research and clinical trial opportunities
- Connect with expert doctors
- Connect with patient support groups
- Get help in managing your disease

V-PPRN Research Studies

The goal of the V-PPRN research program is to conduct high-quality studies that will improve the care and the health of patients with vasculitis by exploring research questions that matter most to patients and advance medical knowledge about vasculitis.

The V-PPRN is currently conducting the following studies in partnership with the [Vasculitis Clinical Research Consortium](#). These studies seek to address research questions that are important to both patients and researchers.

VascWork Study

Although much progress has been made towards finding better medical therapies to treat vasculitis, patients with vasculitis often must manage substantial disease and treatment burdens. Patients with systemic vasculitis may have high rates of work disability and significant loss of personal income from employment. This study will ask questions about:

- **Employment status** (Do patients have to take a prolonged sick leave?)
- **Work productivity** (How many patients have to adjust their work because of the physical demands of the job?)
- **Income** (How many patients have a loss of income following the diagnosis of their disease?)

TAPIR

The Assessment of Prednisone In Remission Trial (TAPIR)

- ❖ Key eligibility criteria include:
 - Diagnosis of granulomatosis with polyangiitis (GPA)
 - Required ≥ 20 mg/day of prednisone at some point in the last 12 months
 - GPA currently in remission
 - Currently taking between 6 mg and 20 mg of prednisone per day
 - Age 18 or older
- ❖ Randomized to reduce prednisone dose to *either* 5 mg or 0 mg a day using standardized taper
- ❖ Subjects followed for 6 months

[^]The Screening and Baseline visits may be combined into 1 visit

^{*}Visit will take place either at the first incidence of a flare or at Month 6

^{*}At month 1, Coordinator will call subject to confirm prednisone dose

60 patients

Primary hypothesis is a difference of $\geq 30\%$ in the relapse rate.

RITAZAREM

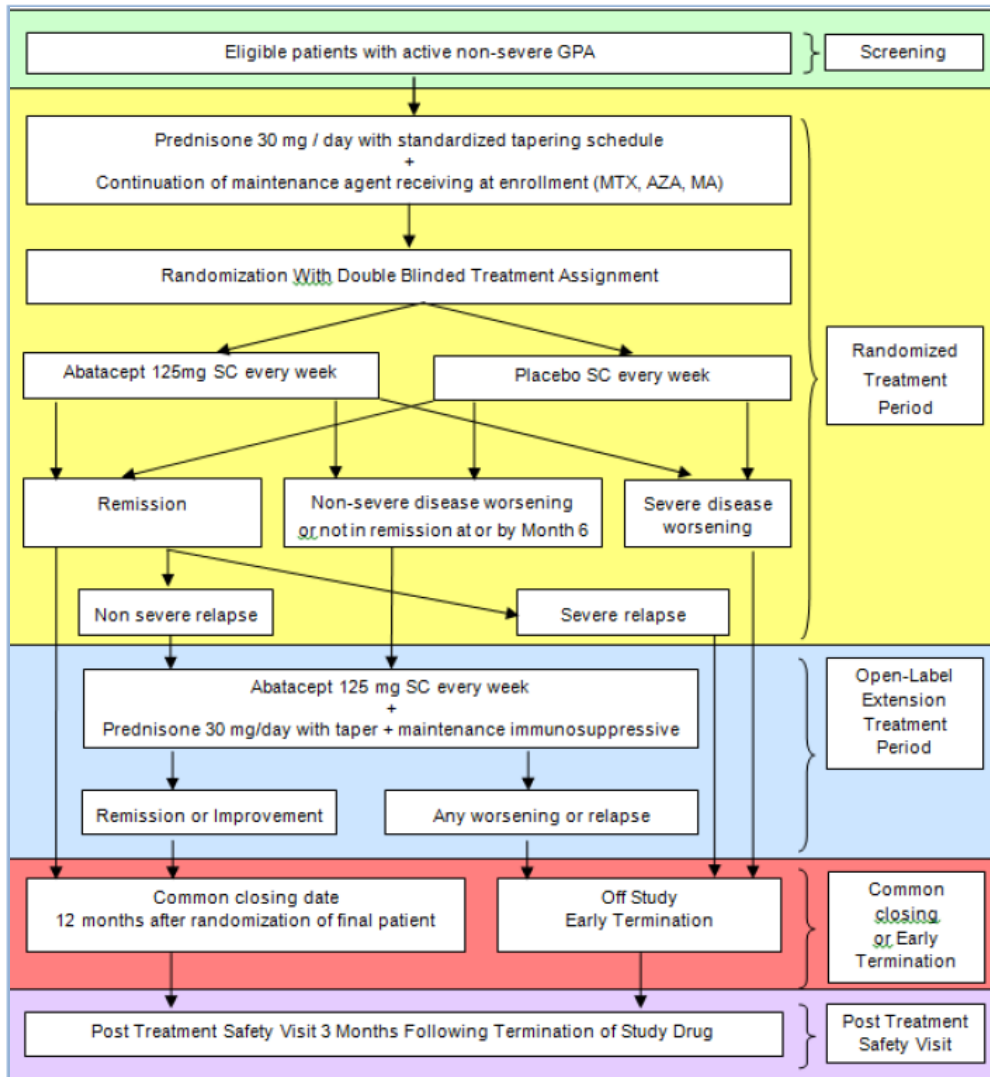

rituximab (RTX) or azathioprine (AZA) for remission after RTX induction

"These won't cure your allergy, but they'll send it a message."

ABROGATE

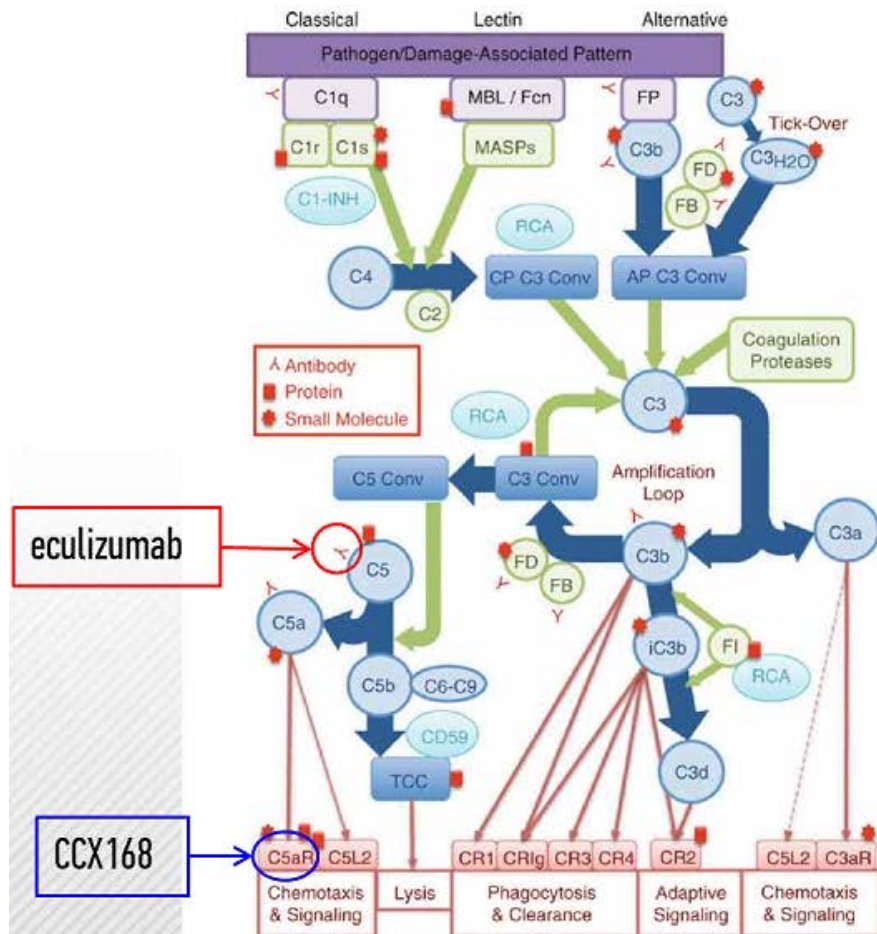

Relapsing non-severe GPA within <28 days (modified ACR criteria):

- a. No disease manifestations that would be scored as a major element in the BVAS/WG
- b. Absence of any disease feature that poses an immediate threat to either a critical individual organ or the patient's life

treatment failure rate through 12 months

→ **150 patients**

Complement Cascade and C5aR

- Complement cascade comprised by over 30 proteins
- Can be activated by three distinct pathways
- All pathways merge to form C3a, C5a, C3b and C5b-9
- Eculizumab (Soliris®) is an anti-C5 antibody
 - IV, expensive, risk of *Neisseria* infection (C5b-9 formation is blocked)
- CCX168 is a C5aR inhibitor
 - Oral, no risk of *Neisseria* infection

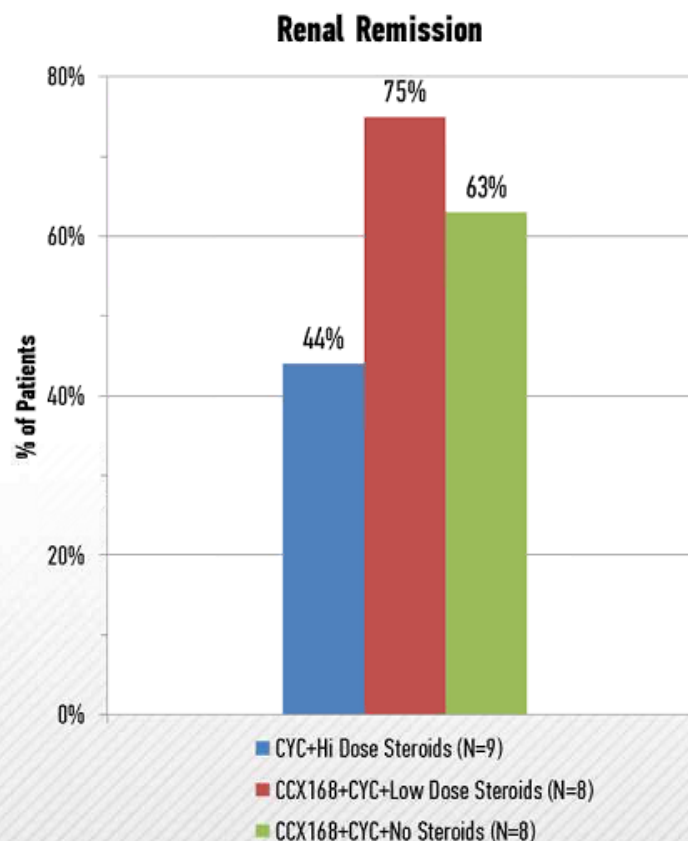

CCX168 Phase 2 Clinical Trial

A Randomized, Double-Blind, Placebo-Controlled, Phase 2 Study to Evaluate the Safety and Efficacy of CCX168 in Subjects with Anti-Neutrophil Cytoplasmic Antibody (ANCA)-Associated Renal Vasculitis on Background Cyclophosphamide Treatment

Three groups:

- 1 **Control: Cyclophosphamide + High Dose Steroids**
 - Good response but high risk (cancer, infections, infertility)
- 2 **CCX168 + Cyclophosphamide + Low Dose Steroids**
 - Tested in Step 1 of the current trial
- 3 **CCX168 + Cyclophosphamide + NO Steroids**
 - Tested in Step 2 of the current trial

CCX168 Group Showed Higher Incidence of “Renal Remission”^{*} Based on Improvement in eGFR AND Hematuria vs. CYC + High Dose Steroid Treatment

^{*} Partial renal response defined as no worsening from baseline in urinary RBCs and improvement in renal function based on eGFR; Renal remission is defined as a reduction from baseline in urinary RBCs and improvement in renal function based on eGFR;

Next step = A RCT in europe and USA-canada

Naïve or relapsing ANCA+ GPA/MPA/RLD, not too severe (1 “major” item, or ≥ 3 other items, or ≥ 2 renal items on the BVAS v.3; eGFR ≥ 20 mL per minute; no severe AH, Sat O₂ >88%)

Up to approximately 45 subjects will be stratified 1:1:1

Group A: CCX168 10 mg BID for 12 weeks + IV CYC-AZA/ritux + CS

Group B: CCX168 30 mg BID for 12 weeks + IV CYC-AZA/ritux + CS

Group C: Placebo BID for 12 weeks + IV CYC/ritux + CS

End point at week 12 (with follow-up until week 24)

Mepolizumab Treatment in Patients with Severe Eosinophilic Asthma

Hector G. Ortega, M.D., Sc.D., Mark C. Liu, M.D., Ian D. Pavord, D.M., Guy G. Brusselle, M.D., J. Mark Fitzgerald, M.D., Alfredo Chetta, M.D., Marc Humbert, M.D., Ph.D., Lynn E. Katz, Pharm.D., Oliver N. Keene, M.Sc., Steven W. Yancey, M.Sc., and Pascal Chanez M.D., Ph.D., for the MENSA Investigators*

ABSTRACT

BACKGROUND

Some patients with severe asthma have frequent exacerbations associated with persistent eosinophilic inflammation despite continuous treatment with high-dose inhaled glucocorticoids with or without oral glucocorticoids.

METHODS

In this randomized, double-blind, double-dummy study, we assigned 576 patients with recurrent asthma exacerbations and evidence of eosinophilic inflammation despite high doses of inhaled glucocorticoids to one of three study groups. Patients were assigned to receive mepolizumab, a humanized monoclonal antibody against interleukin-5, which was administered as either a 75-mg intravenous dose or a 100-mg subcutaneous dose, or placebo every 4 weeks for 32 weeks. The primary outcome was the rate of exacerbations. Other outcomes included the forced expiratory volume in 1 second (FEV₁) and scores on the St. George's Respiratory Questionnaire (SGRQ) and the 5-item Asthma Control Questionnaire (ACQ-5). Safety was also assessed.

ORIGINAL ARTICLE

Oral Glucocorticoid-Sparing Effect of Mepolizumab in Eosinophilic Asthma

Elisabeth H. Bel, M.D., Ph.D., Sally E. Wenzel, M.D., Philip J. Thompson, M.D., Charlene M. Prazma, Ph.D., Oliver N. Keene, M.Sc., Steven W. Yancey, M.Sc., Hector G. Ortega, M.D., Sc.D., and Ian D. Pavord, D.M., for the SIRIUS Investigators*

ABSTRACT

BACKGROUND

Many patients with severe asthma require regular treatment with oral glucocorticoids despite the use of high-dose inhaled therapy. However, the regular use of systemic glucocorticoids can result in serious and often irreversible adverse effects. Mepolizumab, a humanized monoclonal antibody that binds to and inactivates interleukin-5, has been shown to reduce asthma exacerbations in patients with severe eosinophilic asthma.

METHODS

In a randomized, double-blind trial involving 135 patients with severe eosinophilic asthma, we compared the glucocorticoid-sparing effect of mepolizumab (at a dose of 100 mg) with that of placebo administered subcutaneously every 4 weeks for 20 weeks. The primary outcome was the degree of reduction in the glucocorticoid dose (90 to 100% reduction, 75 to less than 90% reduction, 50 to less than 75% reduction, more
